
THE ADVANCED RESEARCH TEAM

Original research, taken to *publication*.

Our most rigorous program. A student develops, researches, and writes a complete, original paper at the college level, under the close mentorship of our research staff, on a track that has placed students' work in peer-reviewed journals.

4–6_{wks}

Of intensive, supervised research

10–40_{pp}

A complete, original research paper

4

Journals and repositories our students have entered

2

Tracks: solo study and team research

Real research, not a class *about research*.

The Advanced Research Team is the most academically rigorous program Admissions Partners offers. Over four to six weeks, a student develops, researches, and writes a complete, original research paper, ten to forty pages, under the direct supervision of our research staff. Projects are interdisciplinary and span the sciences, economics, public policy, technology, and the humanities.

Two ways to *run it*.

TEAM ART

A collaborative *team*.

Most students work in a small group. The team takes on a single large question, divides it across disciplines, and co-authors one paper to a shared standard. Students learn to research alongside peers and to defend their part of a larger argument.

SOLO ART

A single-author *study*.

A student pursuing a dedicated, individual line of inquiry undertakes a Solo ART project. Same standards, same publication track, carried out as a single-author study. The entire paper, from the question to the conclusion, is theirs.

The shape of the *work*.

An ART project is intensive by design. The timeline is short and the standard is high, so a student moves from an open question to a finished, submission-ready paper in a matter of weeks, with our staff at their side at every stage.

4–6

WEEKS · END TO END

i.

Define

Frame an original, answerable question and map the literature.

ii.

Investigate

Gather sources and data, then analyze and build original figures.

iii.

Publish

Write to format, then submit the paper for peer review.

The standard does not bend for the timeline. A Solo ART paper and a Team ART paper are held to the same conventions of academic publishing, the subject of the next page.

Work built to a journal's *expectations*.

An ART paper is held to the conventions of academic publishing, not the conventions of a school assignment. Across the writing process, a student is expected to produce work that a peer-reviewed journal will take seriously.

- 1 An original, evidence-based argument**
Developed from primary sources and the peer-reviewed literature, not a summary of what other people have already written.
- 2 Quantitative and analytical rigor**
The paper engages directly with studies, data, and competing findings, and reaches a conclusion it can defend.
- 3 Original data visualizations**
Every figure and table is the student's own, built and interpreted by them, never borrowed graphics.
- 4 Formal academic structure**
An abstract, keywords, a structured body, and a complete reference list in a recognized citation style.
- 5 Submission-ready scholarship**
A conflict-of-interest statement and the exact formatting a journal requires before it will send a paper for review.

Held to it from the first *draft*.

Meeting this standard is the work. Our research staff reviews the question, the sources, and the analysis at each stage, the same way a journal's reviewers eventually will. A paper is built draft by draft to arrive at submission already meeting a reviewer's expectations, not finished first and corrected later.

WHERE OUR STUDENTS HAVE BEEN PUBLISHED

— American Journal of Student Research
· AJSR

— Curieux Academic Journal

— Social Science Research Network · SSRN

The work, in *print*.

These are recent ART papers our students have published, across medicine, law, international development, and agricultural science. Each was written to the standard on the previous page, then accepted by a peer-reviewed journal.

ORTHOPEDIC SURGERY

SOLO ART

Direct Anterior Versus Posterior Approach in Total Hip Arthroplasty: A Narrative Evidence Review of Recovery, Safety, and Cost

An evidence review weighing two surgical approaches to hip replacement across recovery, safety, and cost. The student synthesized more than a dozen peer-reviewed studies, including a meta-analysis of over 22,000 patients, and reached a conclusion the clinics' marketing does not.

PUBLISHED IN American Journal of Student Research

LAW & ARTIFICIAL INTELLIGENCE

SOLO ART

Artificial Intelligence's Role in Providing Access to the Justice System for Groups with Historically Impeded Access

A mixed-methods study of how large language models can widen access to the courts for low-income, juvenile, and language-barrier defendants, and where algorithmic bias makes a human-in-the-loop model essential to due process.

PUBLISHED IN Curieux Academic Journal

EDUCATION & DEVELOPMENT

SOLO ART

Reclaiming the Promise of EdTech in the Mercosur Region: Lessons for a Pilot Workshop in Paraguay

An original field study built on a ten-week digital-literacy program the student designed and ran with 104 high-school students in Asunción, Paraguay, measured against quantitative benchmarks and the students' own self-assessment. The full story is on the next page.

PUBLISHED IN Journal of Student Research

AGRICULTURAL BIOTECH & ECONOMICS

TEAM ART · FIVE

Genetically Modified Crops as a Sustainable Solution to Global Instability and Climate Change: A Comparative Analysis of Economic and Logistical Impacts

A five-author comparative analysis of whether genetically modified crops are an economically and logistically viable response to food scarcity under a changing climate, drawing on global yield and trade data across regions and staple crops.

PUBLISHED IN Curieux Academic Journal

One program, four disciplines. *A surgeon's evidence review, a legal-technology study, an international field project, and a team analysis of global agriculture, each carried to publication by a high-school researcher.*

Research that leaves the *library*.

An ART project is real research, and real research sometimes has to be done where the question actually is. For one Solo ART student, that meant carrying the work into the field, to Asunción, Paraguay.

Aventura Digital, in session. The program ran ninety-minute workshops for 104 high-school students across five schools in Asunción.

The student designed *Aventura Digital*, a ten-week series of digital-literacy workshops for upper-year high-school students. The curriculum drew on constructivism, situated learning, and the lessons of the One Laptop Per Child project, and it deliberately kept local teachers at the center of the instruction. The student then measured the program against quantitative benchmarks and the students' own self-assessments, and wrote the results up as a study of how digital literacy can be built across the Mercosur region. The paper was published in the Journal of Student Research.

Background research with Paraguay's binational hydroelectric commission.

On the ground in Asunción during the program's pilot phase.

This is what we mean by original research. *Not a report assembled from the internet, but a program a student built, ran, measured, and published.*

Built to end on *paper*.

Every ART project is designed to finish as something concrete, a piece of original scholarship a student can put their name to and send anywhere. By the end, a student holds work that very few high-school applicants can claim.

WHAT AN ART PROJECT PRODUCES

- **A complete, original research paper** of ten to forty pages, the student's own from question to conclusion.
- **A submission-ready manuscript** on a peer-reviewed publication track, formatted to a journal's standard.
- **Original data, figures, and analysis** the student built and interpreted, not borrowed.
- **Close mentorship** from our research staff at every stage, from the first question to the final submission.
- **A research writing sample** that stands on its own in a college application.

The record speaks for the program. *Our students have published in the Journal of Student Research, the American Journal of Student Research, Curieux Academic Journal, and the Social Science Research Network.*

BEGIN A RESEARCH PROJECT

The most rigorous work we *offer*.

Speak with us about whether the Advanced Research Team fits your student's interests and timeline. We will walk you through the project, the standard, and the path to publication.
